Python Task

1. **Write a Python program to:**
    1. Ask the user to enter their **name** and **date of birth (YYYY-MM-DD)**
    2. Calculate the **current age** using the datetime module
    3. Save the result in a file called user_age.txt
    4. Handle errors if the user enters an invalid date format

Sample Output:

Enter your name: Selva

Enter your DOB (YYYY-MM-DD): 2000-05-10

Data saved successfully!

Name: Selva

Age: 25
